

ABSTRACT OF THE DISCLOSURE

A vehicular lamp including a resin-made plain outer cover that covers the lamp body. The plain outer cover has an interior lens step (cylindrical step) formed in a region that faces a gap between an extension element (or a reflector) installed in the lamp body and the inner surface of a leg portion of the outer cover. The lens step optically reduces the gap between the leg portion and the extension element (or a reflector) and thus optically magnifies the leg portion of the outer cover, allowing the lamp to have a sense of stateliness and a sense of luxury seen in the lamp that uses a glass-made outer cover.
